

Yan Gorski

Backend Software Engineer | Distributed Systems | AI Engineering

+55 16 99785-8222 | gorski.yan.93@gmail.com | github.com/yanGORSKI

PROFESSIONAL SUMMARY

Backend Software Engineer with experience in FinTech and enterprise environments, building and maintaining distributed, event-driven systems. Hands-on with Java, Spring Boot, Kafka, RabbitMQ, relational databases, observability and production troubleshooting. Security Champion with recent focus on AI-enabled engineering automation. A research background in Chemistry brings a rigorous, analytical approach to root-cause analysis and complex problem solving.

TECHNICAL SKILLS

Backend: Java | Spring Boot | REST APIs | OOP | Clean Code | Design Patterns

Architecture & Messaging: Microservices | Event-Driven Architecture | Kafka | RabbitMQ

Data: PostgreSQL | Oracle | SQL | PDF Parsing | Data Extraction

Observability & Delivery: Splunk | New Relic | Grafana | Docker | Kubernetes | CI/CD | Git | GitFlow | Heroku | AWS (general)

Security & AI: Snyk | Secure Coding | AI Agents | OpenAI Codex | ChatGPT | AWS Kiro | GitHub Copilot

PROFESSIONAL EXPERIENCE

Invillia | Software Developer | 2023 - Present

FinTech and enterprise systems

- Design and maintain backend services in a distributed microservices ecosystem, using Kafka topics and RabbitMQ queues to support reliable asynchronous communication.
- Investigate complex production incidents with Splunk logs, Oracle/PostgreSQL queries, New Relic and Grafana, validating root causes across internal services and external integrations and helping reduce MTTR.
- Deliver critical bug fixes and feature enhancements through GitFlow, while supporting QA and product teams with business-rule clarification, test-scenario validation and release reliability.
- Modernize legacy components by migrating functionality toward current architectures, applying clean-code and design-pattern practices, and conducting code reviews against architectural guidelines.
- Serve as Security Champion, using Snyk to identify vulnerabilities, promote secure development practices and drive remediation initiatives aligned with organizational standards.
- Apply AI to software engineering workflows by building agents and skills that automate repetitive team activities, including creating remediation work items from vulnerability analyses and generating technical documentation from pull requests.
- Defined the architecture and task decomposition for a web application whose MVP was implemented end-to-end by AI agents, establishing component responsibilities and a structured delivery plan.

Ottimizza | Software Developer | 2022 - 2023

- Developed backend services for large-scale document processing, automating the extraction of essential tax information from client-provided PDF files.
- Expanded parsing rules and generalized the processing mechanism to support new document formats and reduce manual configuration across heterogeneous client inputs.
- Redesigned a legacy file-monitoring tool from a rigid two-level folder tracker into a configurable multi-depth directory scanner, improving integration flexibility in client environments.
- Investigated client-reported issues through log analysis, data validation, PostgreSQL queries and cross-system debugging, separating product defects from client configuration problems.
- Delivered critical fixes and edge-case improvements, managed deployments through Heroku, and produced/consumed Kafka messages for asynchronous communication and client alerts.

EDUCATION

Bachelor's Degree in Information Technology

UNIVESP - Virtual University of the State of São Paulo | 2022 - 2025

Master's Degree in Chemistry

UNESP - São Paulo State University | 2020 - 2022

Bachelor's Degree in Chemistry

UNESP - São Paulo State University | 2014 - 2019

CERTIFICATION & LANGUAGES

GitHub Copilot - GitHub | 2025

Portuguese - Native | English - Advanced
